1 Arduino Board – Serial Communication and LED Output

We have tested the Arduino serial communication described in this Application Note using an Arduino UNO. It should also work on other Arduino boards [3].

Most Arduino boards already have an on-board LED 'L' wired to the output pin no 13. If you run this example with no hardware attached to the Arduino, you should see this on-board LED 'L' blink.

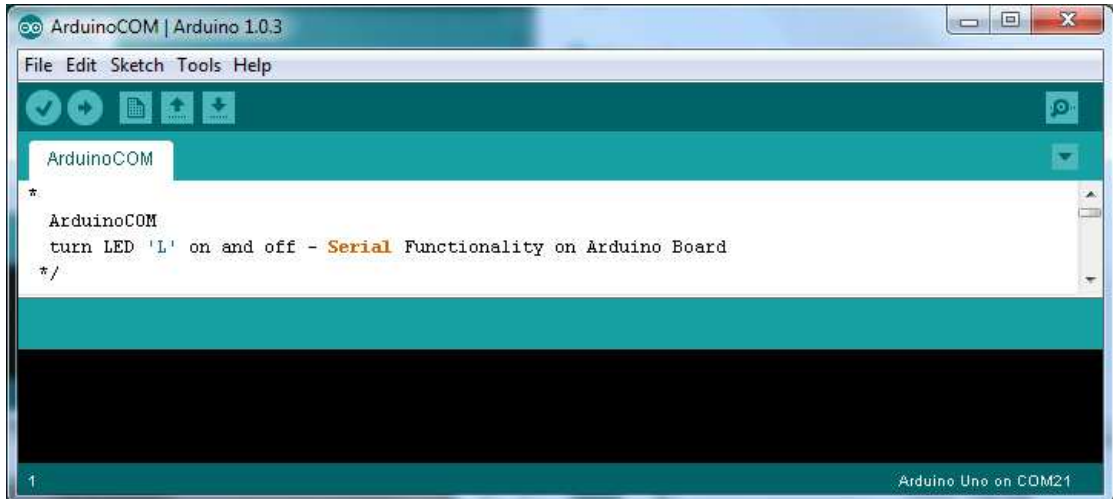

2 Quick Start – Blinking LED Example

This is a very basic Arduino communication and programming example using Docklight. It builds on what is described as the "The "Hello World!" of Physical Computing" [6] on the Arduino web site.

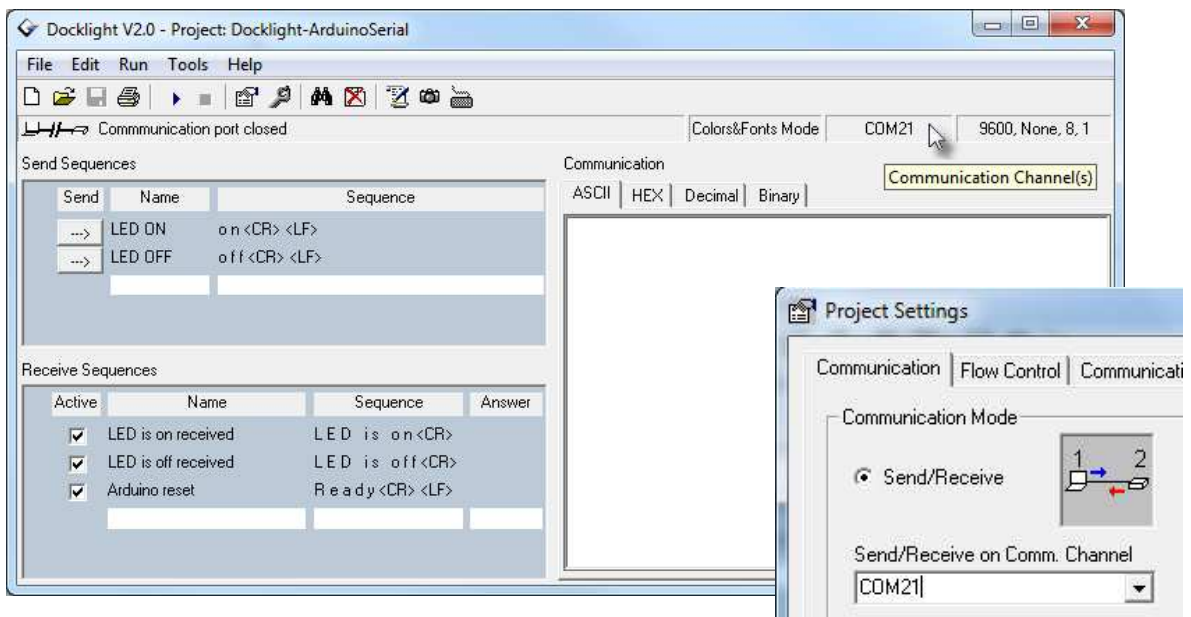

- Download and install Docklight V2.0 (or higher) from http://www.docklight.de/download_en.htm
- Download and install the latest Arduino environment from <http://arduino.cc/en/Main/Software> [4]
- Connect your Arduino board to your PC via USB.
- run **arduino.exe**

				Date	2013-02-20	Docklight Application Note: Arduino Serial Communication Applies to: Docklight / Docklight Scripting V2.0 or higher

Ver.	Comment	Date	Name			1 / 7

- Open the Arduino Sketch file **ArduinoCOM.ino**

- Upload the Sketch to your Arduino board, e.g. by using the arrow right toolbar .
- Start **Docklight** and open the project file **Docklight-ArduinoSerial.ptp**.
- Double click on the **Communication Channel(s)** area that shows COM21 by default, or use menu **Tools -> Project Settings -> Communication** to adjust the COM port, if necessary.

NOTE: The correct COM port to use is shown in the right lower corner of the **Arduino** environment (**COM21** in this example).

You can also find out using the **Windows Device Manager**: Use the Windows **Start** menu and type **Device Manager** in the search box. In the Device Manager dialog, check the section **Ports (COM & LPT)** for the Arduino entry.

TIP: If the COM port used for your Arduino Hardware is not shown in Docklight Project Settings drop down list, just type in the correct COM port in the text box, e.g. COM21.

Ver.	Comment	Date	Name			2 / 7

- Press **Start Communication (F5)** in Docklight.

You should see this message in the Docklight Communication Window (**ASCII**)

```
2013-02-18 20:07:09.024 [RX] - Ready
<CR><LF>
Arduino communication established
```

- Using the Docklight **Send -->** buttons, you can now transmit the **LED ON** and **LED OFF** ASCII commands to your Arduino board.

ASCII Commands and confirmation messages from the Arduino are shown in the Docklight Communication Window (ASCII):

```
2013-02-18 20:08:44.297 [TX] - on<CR><LF>
2013-02-18 20:08:44.304 [RX] - LED is on<CR><LF>
Arduino reports: LED on

2013-02-18 20:08:46.031 [TX] - off<CR><LF>
2013-02-18 20:08:46.041 [RX] - LED is off<CR><LF>
Arduino reports: LED off
```

Of course you will now also see the Arduino board LED 'L' or an external PIN13 LED turned off or on.

3 Advanced Example: Creating Morse Codes Using Docklight Scripting

This is a more advanced command sequence example using **Docklight Scripting**, an extended edition of Docklight that features a VBScript-based programming environment.

NOTE: VBScript/Docklight Scripting provide easy serial communication access and similar programming capabilities to the Arduino C/C++ language set, but the language syntax is different in detail. See also <http://www.docklight.de/manual/vbscriptoverview.htm> [2] and <http://arduino.cc/en/Reference/Comparison> [9].

How to run the Docklight Scripting example:

- Make sure the Arduino environment is set up and ready, as explained in the previous section 2: "Quick Start – Blinking LED Example".
- Download and install Docklight Scripting V2.0 (or higher) from http://www.docklight.de/download_en.htm
- Start Docklight Scripting and open the project file **Docklight-ArduinoSerial.ptp**. Then open the script **Docklight-Arduino-MorseCode.pts**, using menu **Scripting -> Open Script...**
- Run the script using menu **Scripting -> Run Script (Shift+F5)**.

You should see these messages in Docklight Communication Window (**Hex**)

```

2013-02-18 20:22:34.924 [RX] - 52 65 61 64 79 0D 0A  Arduino communication established

  Sending character 'S' = ...

LED off
    
```

And of course the Arduino LED should blink and send out that famous Morse code [10] sequence we all know from them sinking ships movies...

4 Appendix A: ArduinoSerialLED.ino Program Code

```

/*
  ArduinoSerialLED.ino
  turn LED 'L' on and off via 'Serial' Functionality on Arduino Board
*/

// use output pin no. 13 / on board LED 'L'
const unsigned int LED_PIN = 13;

// use standard baud rate 9600 baud.
const unsigned long BAUD_RATE = 9600;
// Other baud rates are possible, too, e.g. 57600. Just make sure your
// Docklight project settings are adjusted accordingly
// (Docklight menu Tools -> Project Settings ... -> Communication).

// init command buffer
String command = "";
boolean command_available = false;

// the setup routine runs once when you press reset:
void setup() {
  // initialize serial communication according to BAUD_RATE:
  Serial.begin(BAUD_RATE); // other settings are SERIAL_8N1, 8 data bits, no parity, one
  stop bit
  while (!Serial) {
    ; // wait for serial port to connect. Needed for Leonardo only
  }
  pinMode(LED_PIN, OUTPUT); // configure LED_PIN as output

  // Serial.available() < 0 would indicate an error on initialization
  if (Serial.available() >= 0)
    Serial.println("Ready"); // send Ready<CR><LF> at start/reset
}

// after completing setup(), this gets called consecutively
void loop() {
  if (command_available) {
    // commands received need to be terminated by <CR><LF> characters
    // (same as Serial.println does it)
    if (command == "on\r\n") {
      digitalWrite(LED_PIN, HIGH);
      Serial.println("LED is on");
    }
    else if (command == "off\r\n") {
      digitalWrite(LED_PIN, LOW);
      Serial.println("LED is off");
    }
    else {
      Serial.print("Unknown command: "+ command);
    }
    command = ""; // clear input buffer
    command_available = false;
  }
}

// event Handling - reading characters
void serialEvent(){
  while (Serial.available() && !command_available) {
    const char c = Serial.read();
    if (c == '\n') { // Linefeed character is end-of-command mark
      command += c;
      command_available = true;
    }
  }
}

```
